

Analysis on a Graph

Kumari Pooja

November 2020

Here, we will do the analysis of following graph which is related to World citizens living under different political regimes.

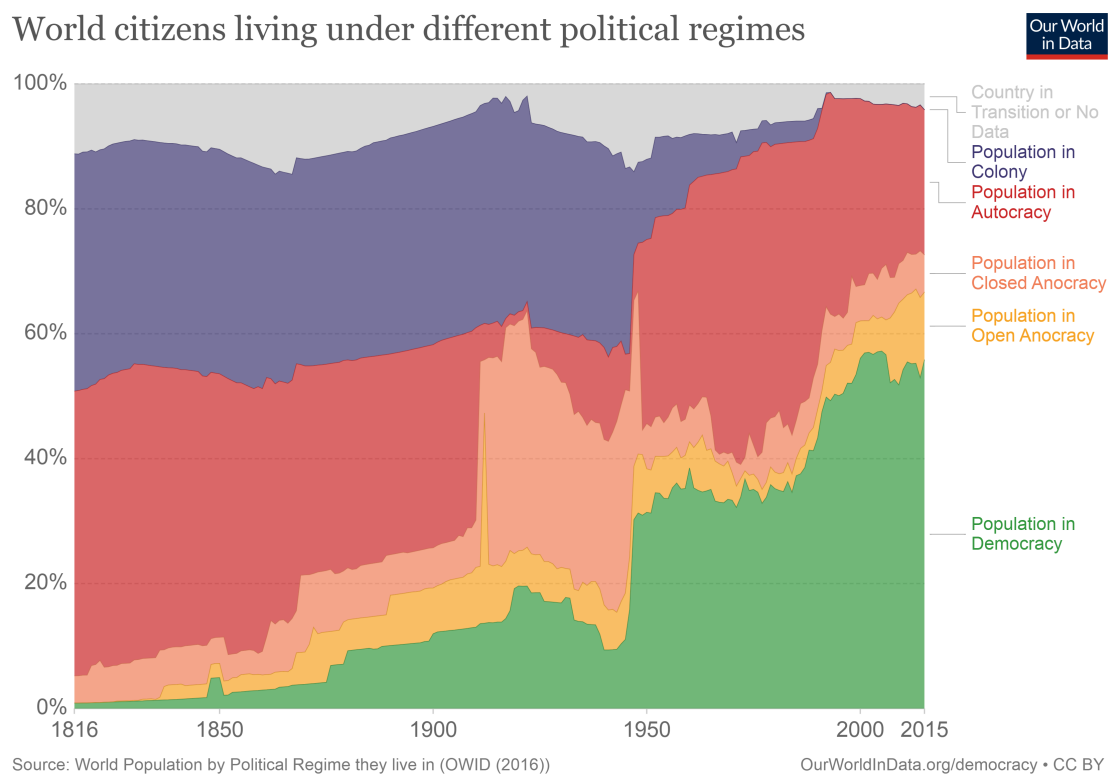

Figure 1: World citizens under different political regimes

The graph in the figure 1, describes the world population governed under the six different political regimes between 1816 and 2015. It is observed that the world population has exploded over the period of 200 years. However, this change in the population has witnessed different trends under various governance style and pre and post-world war periods. From the graph, we observe that the 40% of world population in the colonies remained constant until early 1950's and declined to merely 5% in the later half as an era of colonization ended and countries started establishing democratic governance. This information is validated by the fact that population in democracy increased from 8% to 58% by early 2000. Apart from colonies, majority of the other population lived under autocracy and anocracy, which consisted of 50% of the world's population. The only time when we observe steep decline in the population is during

the period of 1910- 1945. We see a decline of 19% the population under autocratic rule and 8% under anocracy; this was the period when the most powerful dictators commanded their troops to fight the World War. During the latter half of the 20th century, colonies and autocracies came to an end, countries gained independence and elected peoples representatives to rule the countries establishing harmony. In today's world more than 50% of the population lives under democracy, whereas 22% under autocracies.
